The thickly padded **RossoCorsa glove** (left) when hand protection is paramount. The palm of the glove features 3 gel pads that absorb shocks from the uncomfortable cobblestones, but allow full breathability because they're perforated. The rest of the glove is in a lightweight soft mesh for breathability and to make you almost forget you have it on.

The new **Diluvio Gloves** (right) are made for cold and/or wet conditions. The Japanese neoprene is some of the highest quality available and this is what makes it so stretchy, comfortable and warm. The seams are constructed using the same technique as a wetsuit: the stitching is only on the outside, while the inside is thermo welded to make it smooth and completely waterproof.

While the waterproofness is an obvious benefit in the rain, what's not so obvious is how good this glove is in the cold. It keeps your hands warm with the same function as a wetsuit for divers. It is completely non breathable, so your hand sweats but that moisture is immediately warmed to body temperature and stays warm. We figure it's better to have hands warm and wet than dry and cold, or worse yet wet and cold!
